

Exam Topics:

- Sub-queries in SQL (incl. understanding joins and aggregates) ✓
- Recursion in SQL ✓
- Database Design Principles
- Space filling curves
- ER Diagram and Model
- Indexes (Ordered, hash, tree based)

Exam Format:

- Bunch of MCQ
- some T/F
- Bunch of short answer questions (on SQL, indexes, ER, etc.)

Subquery Practice:

IQ28. Employees whose Manager Left the Company

- Find ID's of employees whose salary is strictly less than \$30000
AND
- Find ID of those whose manager left the company

Employee:

employee_id	name	manager_id	salary
3	Mila Andonella	9 null	60301 31000
12	Emer	null	67064
13	Kalel	11	21291
9	Micaela	null	30937
11	Joziah	6	28485

```

SELECT employee_id
FROM Employees
WHERE salary < 30000
AND manager_id NOT IN
(SELECT employee_id FROM Employees)
ORDER BY employee_id
    
```

Recursion in SQL

- Write recursive query in SQL to generate numbers from 1 to 10.

WITH RECURSIVE cte AS (

SELECT 1 AS N

UNION ALL

SELECT $N+1$

FROM cte

WHERE $N < 10$

)

- Write recursive factorial query in SQL

WITH RECURSIVE cteFact AS (

SELECT 1 AS N, 1 AS fact

UNION ALL

SELECT N+1, (N+1) · fact

FROM cteFact

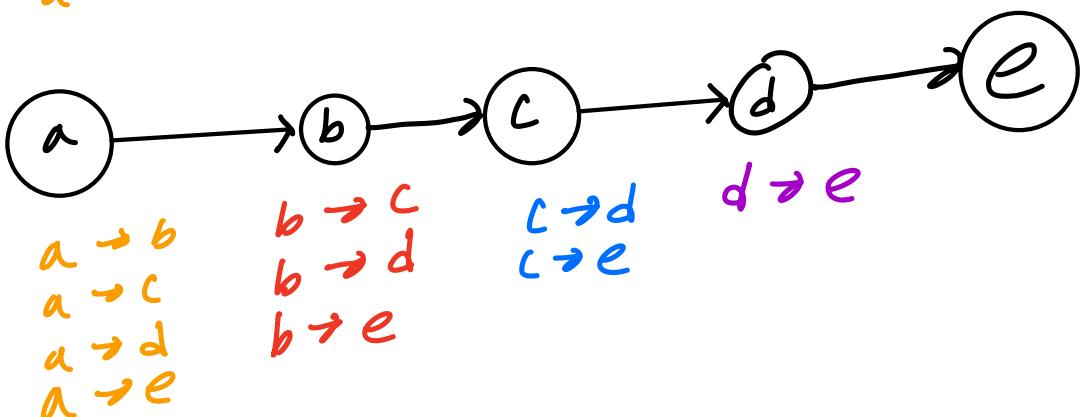

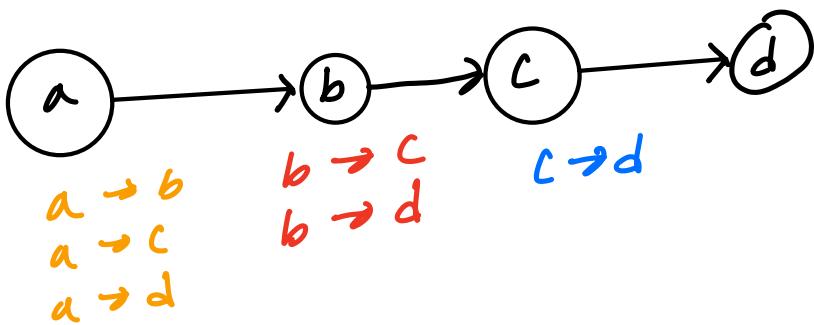

WHERE N < 10

) ;

SELECT N, fact
FROM cteFact

Transition Closure Review

- For a chain graph with n nodes, come up with a closed-form formula for the total # of edges in the transitive closure of the chain graph.

Closed Form:

$$\frac{N(N-1)}{2}$$

$$\text{Ex: } \frac{s \cdot (s-1)}{2} = 10$$

Space Filling Curves

- Consider a 2D image of resolution 8×8 . Compute Morton code (z-order code) for the following 2D points:
 - $(s_y, s_x) = S1$

- (s_y^3, s_x^2)

Using (s_y, s_x) :

- Since it is an 8×8 grid, we will represent the numbers as 3-bit.

$$s = 101$$

$$s = 101$$

Combine them in the order of:

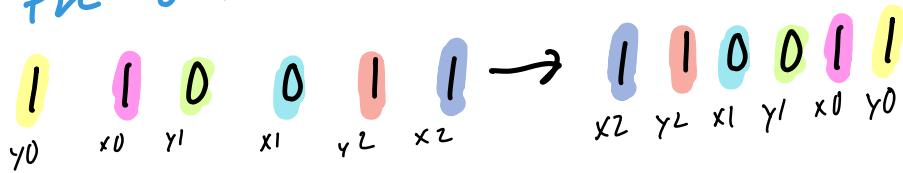

$$(y_0, x_0, y_1, x_1, y_2, x_2)$$

$\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow$

1	1	0	0	1	1
---	---	---	---	---	---

- Since the 0th bit is binary stalls all the way at the right, reverse

The Order.

$$\begin{array}{ccccccc} 1 & 1 & 0 & 0 & 1 & 1 \\ 2^5 & 2^4 & 2^3 & 2^2 & 2^1 & 2^0 \\ 32 + 16 + 0 + 0 + 2 + 1 = 51 \end{array}$$

Using $(3, 2)$:

- Since it is an 8×8 grid, we will represent the number as 3-bit.

$$3 = \begin{smallmatrix} 0 & 1 & 1 \\ y_2 & y_1 & y_0 \end{smallmatrix} \quad (011, 010)$$

$$2 = \begin{smallmatrix} 0 & 1 & 0 \\ x_2 & x_1 & x_0 \end{smallmatrix}$$

Combine them in the order of:

$$(y_0, x_0, y_1, x_1, y_2, x_2)$$

$\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow$

$$\begin{matrix} 1 & 0 & 1 & 1 & 0 & 0 \end{matrix}$$

- Since the 0th bit in binary starts all the way at the right, reverse

The Order.

$$\begin{array}{ccccccccc} 1 & 0 & 1 & 1 & 0 & 0 & \rightarrow & 0 & 0 \\ y_0 & x_0 & y_1 & x_1 & y_2 & x_2 & & x_2 & y_2 \\ & & & & & & & 2^5 & 2^4 \\ & & & & & & & 32 & 16 \\ & & & & & & & 0 & 0 \\ & & & & & & & 1 & 1 \\ & & & & & & & 2^1 & 2^0 \\ & & & & & & & 2 & 1 \\ & & & & & & & 4 & 1 \\ & & & & & & & 13 & \end{array}$$

$$\begin{array}{c} 101101 \\ x_2 x_1 x_0 \\ y_2 y_1 y_0 \\ \hline 101101 = 41 \end{array}$$

$$\begin{array}{c} 01100 \\ x_2 x_1 x_0 \\ y_2 y_1 y_0 \\ \hline 01100 = 24 \end{array}$$
